

Custom Made Head prosthesis in PMMA made directly by the doctor in the operating room using a medical silicone mold: **Skulpturas**, technical notes.

V.Dallolio, U.O. Neurochirurgia , ICCS, Milano

A procedure is presented for the realization of a Custom Made Cranial prosthesis, where the doctor will have a primary role as already with the PMMA manual prosthesis

The **Skulpturas** mold made of medical silicone based on the patient's specific CT data, available in 5 days, is sterilized, like other surgical instruments, by steam, at 134 ° C.

The Neurosurgeon, who still today, often for business needs, uses the skull-resin and manually makes the prosthesis with all the difficulties, problems and failures that we know well. With the **Skulpturas** mold, personalized by the patient, he can realize the Custom Made prosthesis in 10 minutes (with all the advantages of traditional Custom Made), but at a much lower cost and with very short waiting times of 5 days.
